1. Get started with DocuScan Pro

Overview of the four main workflows and the Home screen.

Purpose

Understand what DocuScan Pro does and where to begin.

What you need

A web browser. No account required.

Steps

1. Welcome. DocuScan Pro is a browser-based tool for scanning documents, creating PDFs, signing them, and organizing files locally. Everything stays on your device.

2. Home screen. When you open the app you land on the Home screen. It shows four prominent workflow cards: Studio, Sign, PDF Tools, and Library.

3. Quick start list. Below the four cards, a Quick start list lets you jump directly into the most common tasks: scanning, signing, or opening a saved document.

4. Bottom navigation. The bar pinned to the bottom of every screen has six icons: Home, Sign, Tools, Studio, Library, and Help. Use it to switch workspaces at any time.

Troubleshooting

If you don't see the four cards, you may have scrolled — try scrolling up or pressing Home in the bottom navigation.

Related topics

Scan or import a document, Sign a PDF document, Merge two or more PDFs, Use the document Library

2. Scan or import a document

Capture with your camera or import existing images, then build a PDF.

Purpose

Turn paper documents or existing images into clean PDF files.

What you need

A camera-equipped device (for capture) or images on your device.

Steps

1. Open Studio. Tap Studio in the bottom navigation, or the Studio card on the Home screen.

2. Capture with camera. Tap "Capture with camera". Your browser will request camera permission. On phones, the rear camera is preferred. Capture a page; tap to retake if needed.

3. Or import images. Tap "Import images" to choose existing image files (JPG, PNG). You can select multiple files at once.

4. Review thumbnails. Captured or imported pages appear in the Pages strip as numbered thumbnails. Tap a thumbnail to select it. Selected pages are outlined in blue.

5. Rotate, reorder, delete. Use Rotate, Move left, Move right, or Delete on the selected page. Clear all empties the strip.

6. Enhance. Pick a preset (Auto, Grayscale, B&W, Brighten, Contrast+), optionally adjust Brightness / Contrast sliders, then tap Apply to selected page. The original is preserved — Reset restores it.

7. Recognize Text (optional). Tap Recognize Text on the selected page to recognize text using Tesseract.js. The first run may take longer while the engine initializes. Recognized text appears in the textarea and can be copied or downloaded as .txt.

8. Create the PDF. Choose page size (Letter, A4, or Fit-to-image) and orientation (Auto, Portrait, Landscape), then tap Create PDF. The PDF is saved to your Library automatically.

9. Hand off. Use Edit in Sign or Edit in Tools to continue working on the new PDF without leaving the app.

Troubleshooting

If the camera doesn't open, check browser permissions (Settings → Privacy → Camera) and confirm you're on HTTPS. As a fallback, use Import images to pick a photo from your camera roll.

Related topics

Enhance image quality, Recognize text with OCR, Create a PDF from pages, Use the document Library

3. Enhance image quality

Brighten, sharpen, convert to grayscale or black-and-white.

Purpose

Improve readability of scanned or photographed pages.

What you need

At least one page loaded in Studio.

Steps

1. Select a page. Tap the thumbnail of the page you want to improve. A blue outline confirms the selection.

2. Choose a preset. Tap one of the chips in the Enhancement section: Original, Auto, Grayscale, B&W, Brighten, or Contrast+.

3. Fine-tune (optional). Drag the Brightness and Contrast sliders. The numbers update live (-100 to +100).

4. Apply. Tap Apply to selected page. The thumbnail updates to reflect the changes.

5. Reset. Tap Reset to restore the original image. The original canvas is preserved, so this is always safe.

Troubleshooting

If the thumbnail doesn't change after Apply, make sure a page is selected (blue outline) before tapping Apply. If the colors look wrong, try Original to revert.

Related topics

Scan or import a document, Recognize text with OCR, Create a PDF from pages

4. Recognize text with OCR

Extract searchable, copyable text from scanned pages.

Purpose

Turn scanned images into editable, searchable text.

What you need

A scanned page with printed text. Handwriting is not well supported.

Steps

1. Select a page. Tap a thumbnail in the Pages strip.

2. Recognize Text. Tap Recognize Text. The status badge shows "Working…" while Tesseract.js initializes and processes the page.

3. Watch the progress bar. A progress bar appears below the Recognize Text button. On the first run it may pause while the language model downloads (a few MB).

4. Review recognized text. When complete, the recognized text appears in the textarea. It may include minor errors — OCR is never perfect.

5. Copy or download. Tap Copy text to copy to the clipboard, or Download .txt to save a text file.

Troubleshooting

If OCR returns "(No text recognized.)", try a higher-resolution scan, sharper lighting, or convert the image to B&W first. The first run can take 10-20 seconds while assets load; later runs are faster.

Related topics

Scan or import a document, Enhance image quality, Create a PDF from pages

5. Create a PDF from pages

Combine images into a single PDF with the page size you want.

Purpose

Assemble one or more images into a single PDF document.

What you need

At least one page loaded in Studio.

Steps

1. **Choose page size.** In the Create PDF section, pick Letter (8.5×11"), A4 (210×297mm), or Fit to image.

2. **Choose orientation.** Pick Auto (uses each image's aspect ratio), Portrait, or Landscape.

3. **Create PDF.** Tap Create PDF. The PDF is built with pdf-lib and saved to your Library automatically. A toast confirms the save.

4. Hand off. Optionally tap Edit in Sign or Edit in Tools to continue working.

Troubleshooting

If Create PDF is disabled, add at least one page first. If the button shows a spinner forever, the network may be slow loading pdf-lib — try again in a moment.

Related topics

Scan or import a document, Sign a PDF document, Use the document Library

6. Sign a PDF document

Open an existing PDF and add your signature, then download.

Purpose

Add your signature to an existing PDF.

What you need

A PDF file on your device.

Steps

1. Open the PDF. Tap Open PDF from Files at the top of the left sidebar in the Sign workspace. Choose a PDF. It loads in the preview on the right.

2. Create a signature. Tap the Signature button (one of the six editing buttons in two rows of three). A sheet slides up with two tabs: Draw and Type.

3. Draw or type. In Draw mode, sign with your finger, Apple Pencil, or mouse on the signature pad. In Type mode, enter your name and pick a font style.

4. Insert. Tap Insert signature. The signature is placed at the center of the current page as a movable overlay.

5. Move and resize. Click the signature to select it (blue border + resize dot appears). Drag the body to move; drag the blue dot in the bottom-right corner to scale.

6. Download. When you're happy, tap Download PDF to save the signed PDF to your device. Use Save to Library if you want to keep it in the app for later.

Troubleshooting

If the signature doesn't appear, check that you're on the correct page (use the page navigation bar). If the overlay shows the wrong color, set the Ink color before inserting.

Related topics

Add text to a PDF, Insert the current date, Add a watermark to a PDF, Use the document Library

7. Add text to a PDF

Insert custom text or use Quick Text Templates.

Purpose

Add typed text or reusable phrases to a PDF.

What you need

A PDF open in the Sign workspace.

Steps

1. Type your text. In the Text / typed signature field, type the text you want to insert. Or pick from Quick Text Templates (Approved, Received, Paid, Confidential, Draft, Final, For Review).

2. Choose font. Pick a Font style (Helvetica, Times Roman, Courier, etc.) and a Font size in points. This controls the text inside the PDF, not the interface.

3. Pick ink color. Use the Ink color color picker. The color you pick is the color of the text in the final PDF.

4. Insert. Tap the Text editing button to insert at the page center, OR click directly on the preview canvas to drop the text exactly where you clicked.

5. Move and resize. Click the text element to select it. Drag the body to reposition; drag the blue dot in the bottom-right corner to scale.

Troubleshooting

If nothing happens when you click on the page, make sure the Text / typed signature field isn't empty — type something first. If the ink color doesn't match, set the color before inserting.

Related topics

Sign a PDF document, Insert the current date, Add a watermark to a PDF

8. Insert the current date

Add today's date to a PDF in one tap.

Purpose

Stamp the current date onto a PDF.

What you need

A PDF open in the Sign workspace.

Steps

1. **Pick font and color.** Set the Font style, Font size, and Ink color as you want the date to appear.

2. **Tap Date.** Tap the Date button (one of the six editing buttons). Today's date is inserted near the bottom of the current page.

3. **Move if needed.** Click the date text to select it, then drag to move it to your preferred position.

Troubleshooting

The date is generated by your browser's locale. If the format isn't what you want, type your own date into the Text field instead and use the Text button.

Related topics

Sign a PDF document, Add text to a PDF, Add a watermark to a PDF

9. Add a watermark to a PDF

Stamp DRAFT, CONFIDENTIAL, or any text across all pages.

Purpose

Apply a text watermark to every page of a PDF.

What you need

A PDF open in the Sign workspace.

Steps

1. Configure the watermark. In the Watermark section: set Watermark text (default DRAFT), pick Direction (Diagonal ↗️ or Horizontal), and set Opacity (0-100%).

2. Insert. Tap Insert. The watermark is applied across ALL pages of the document. A badge confirms "Watermark applied".

3. Verify. The displayed opacity value matches the actual opacity baked into the PDF.

4. Remove. Tap Remove watermark to revert. (Note: this currently reverts to the originally-loaded PDF and discards other edits added after the watermark.)

Troubleshooting

If the watermark is invisible, increase the Opacity. At 0% it's fully transparent. At 100% it's solid gray text.

Related topics

Sign a PDF document, Add text to a PDF, Apply a watermark in PDF Tools

10. Undo, Redo, and Remove Selected

Correct mistakes and remove individual elements.

Purpose

Revert changes and clean up unwanted elements.

What you need

A PDF open in the Sign workspace.

Steps

1. **Undo.** Tap Undo (one of the six editing buttons, bottom row). Each press reverts to the previous state in the history stack.

2. **Redo.** Tap Redo to re-apply a change you just undid. The Redo stack clears when you make a new edit.

3. **Remove Selected.** Tap an element on the canvas to select it (blue border + resize dot). Then tap Remove Selected to delete it.

Troubleshooting

If Undo is disabled, you're at the bottom of the history stack. If Remove Selected is disabled, no element is currently selected — click on one first.

Related topics

Sign a PDF document, Add text to a PDF, Add a watermark to a PDF

11. Save, download, share, and print

Four export actions available across Studio, Sign, and PDF Tools.

Purpose

Understand the four consistent export actions and when to use each.

What you need

A document ready to export.

Steps

1. Save to Library. Stores the document in the app's local IndexedDB library. Use this when you want to come back to the document later from inside DocuScan Pro.

2. Download PDF. Triggers a browser download of the PDF file to your device. The file lands in your normal Downloads folder.

3. Share PDF. Uses the native Web Share API on supporting devices (mobile Safari, Chrome on Android). On desktop or unsupported browsers, it falls back to a download automatically.

4. Print PDF. Opens the browser's print dialog in a hidden iframe so you don't lose your place in the app. Choose your printer and paper as usual.

Troubleshooting

If Share doesn't show the system sheet, your browser doesn't support Web Share API for files — use Download instead. Print may pop a blocker; allow pop-ups for the app.

Related topics

Sign a PDF document, Use the document Library, Merge two or more PDFs

12. Merge two or more PDFs

Combine multiple PDFs into one document.

Purpose

Combine several PDFs into a single file.

What you need

Two or more PDF files on your device.

Steps

1. **Open the primary PDF.** In PDF Tools, tap Open PDF. This is File A — the base document.
2. **Open a second PDF.** Tap Open 2nd PDF (for merge). This is File B.
3. **Select Merge.** Tap the Merge tab in the Operation row.
4. **Choose order.** Pick Append second PDF (B comes after A) or Prepend second PDF (B comes before A).
5. **Run.** Tap Run. The merged PDF appears in the Preview area.
6. **Export.** Use Save to Library, Download, Share, or Print at the bottom of the card.

Troubleshooting

If Run is disabled, you haven't loaded both PDFs yet. Open PDF = File A, Open 2nd PDF = File B.

Related topics

Split a PDF by page ranges, Rotate PDF pages, Use the document Library

13. Split a PDF by page ranges

Divide a multipage PDF into separate files.

Purpose

Extract specific pages or ranges from a PDF.

What you need

A PDF with multiple pages.

Steps

1. **Open the PDF.** Tap Open PDF in PDF Tools.

2. **Select Split.** Tap the Split tab.

3. **Enter ranges.** Type page ranges in the format 1-3,5,8-10. Spaces around the dashes are optional. The total page count is shown for reference.

4. **Run.** Tap Run. The first split file appears in the Preview area; additional files are saved to your Library automatically with names like "Split part 2".

5. **Export.** Use Save / Download / Share / Print for the first file. Additional parts are already in your Library.

Troubleshooting

If you see "Range X-Y out of bounds", check the total page count shown in the panel. Ranges are 1-indexed and must satisfy 1 ≤ from ≤ to ≤ total.

Related topics

Merge two or more PDFs, Rotate PDF pages, Reorder PDF pages

14. Rotate PDF pages

Rotate every page by 90°, 180°, or 270°.

Purpose

Fix pages that are sideways or upside down.

What you need

A PDF open in PDF Tools.

Steps

1. **Open the PDF.** Tap Open PDF in PDF Tools.
2. **Select Rotate.** Tap the Rotate tab.
3. **Pick angle.** Tap 90°, 180°, or 270°. Rotation is applied cumulatively on top of the existing orientation.
4. **Run + Export.** Tap Run to apply, then use Save / Download / Share / Print.

Troubleshooting

Rotation applies to ALL pages in the document. If you need to rotate only specific pages, split first, rotate the part, then merge.

Related topics

Merge two or more PDFs, Split a PDF by page ranges, Reorder PDF pages

15. Reorder PDF pages

Rearrange pages into a new sequence.

Purpose

Change the page order of a multipage PDF.

What you need

A multipage PDF open in PDF Tools.

Steps

1. **Open the PDF.** Tap Open PDF in PDF Tools.

2. **Select Reorder.** Tap the Reorder tab.

3. **Enter new order.** Type a comma-separated list of the new page positions, 1-indexed. For a 3-page PDF, "3,1,2" moves page 3 to position 1, page 1 to position 2, and page 2 to position 3. The placeholder shows the default order.

4. **Run + Export.** Tap Run, then Save / Download / Share / Print.

Troubleshooting

The list must be a complete permutation. For 3 pages you need exactly 3 unique numbers from 1-3. Duplicates or missing numbers will be rejected.

Related topics

Rotate PDF pages, Split a PDF by page ranges, Merge two or more PDFs

16. Annotate a PDF with text

Add typed annotations like "Reviewed by J.S." to a chosen page.

Purpose

Add text annotations to PDF pages.

What you need

A PDF open in PDF Tools.

Steps

1. **Open the PDF.** Tap Open PDF in PDF Tools.
2. **Select Annotate.** Tap the Annotate tab. Two sub-tabs appear: Text and Draw.
3. **Stay in Text mode.** The Text sub-tab is active by default.
4. **Set page + text.** Pick the Page number and type the annotation Text (e.g. "Reviewed by J.S.").
5. **Position + color.** Set Position X and Position Y as percentages (0-100), pick an Ink color, and a Font size in points.
6. **Run + Export.** Tap Run to bake the annotation into the PDF, then Save / Download / Share / Print.

Troubleshooting

If Run is disabled, type some text first. The annotation appears at the chosen X/Y position (0,0 = top-left; 100,100 = bottom-right).

Related topics

Draw freehand on a PDF, Apply a watermark in PDF Tools, Add text to a PDF

17. Draw freehand on a PDF

Circle, underline, or mark up a PDF with your finger, Apple Pencil, or mouse.

Purpose

Add freehand drawings (circles, arrows, underlines) directly onto PDF pages.

What you need

A PDF open in PDF Tools, ideally with Preview loaded.

Steps

1. **Open the PDF.** Tap Open PDF in PDF Tools. Wait for the page to render in the Preview area.

2. **Select Annotate → Draw.** Tap the Annotate tab, then the Draw sub-tab.

3. **Choose pen settings.** Pick the Page to draw on, choose a Pen color, and adjust Pen width (1-20).

4. **Draw.** Draw directly on the page preview with your finger, Apple Pencil, or mouse. Strokes appear in real time on the transparent overlay.

5. **Clear (optional).** Tap Clear strokes to start over without affecting the underlying PDF.

6. **Run + Export.** Tap Run to bake the strokes into the PDF as a transparent PNG layer. Then use Save / Download / Share / Print.

Troubleshooting

If the draw canvas doesn't respond, make sure you're in the Draw sub-tab (not Text). The overlay sits exactly on top of the rendered page — strokes map 1:1 to PDF coordinates.

Related topics

Annotate a PDF with text, Apply a watermark in PDF Tools, Sign a PDF document

18. Apply a watermark in PDF Tools

Same as the Sign workspace watermark, but accessed via PDF Tools.

Purpose

Apply a text watermark across all pages of a PDF.

What you need

A PDF open in PDF Tools.

Steps

1. **Open the PDF.** Tap Open PDF in PDF Tools.
2. **Select Watermark.** Tap the Watermark tab.
3. **Configure.** Set Watermark text, Direction (Diagonal or Horizontal), and Opacity (0-100%).
4. **Run + Export.** Tap Run, then Save / Download / Share / Print.

Troubleshooting

Identical to the Sign workspace watermark. See "Add a watermark to a PDF" for more detail.

Related topics

Add a watermark to a PDF, Annotate a PDF with text

19. Compare two PDFs side-by-side

View File A and File B at the same scale for visual comparison.

Purpose

Visually compare two PDFs without leaving the app.

What you need

Two PDF files on your device.

Steps

1. **Open File A.** Tap Open PDF in PDF Tools. This is File A.
2. **Open File B.** Tap Open 2nd PDF (for merge). This is File B.
3. **Select Compare.** Tap the Compare tab. The Preview area below shows two labeled panes.
4. **Run.** Tap Run. Both first pages render at 380px width in their labeled panes.
5. **Compare.** Scroll the page to see both side-by-side. On mobile (below 768px), the panes stack vertically.

Troubleshooting

Compare is view-only — it doesn't modify either PDF. To produce a merged file, use the Merge tab instead.

Related topics

Merge two or more PDFs, Use the document Library

20. Use the document Library

Local storage, open / rename / delete saved documents.

Purpose

Manage documents saved locally in your browser.

What you need

None. The Library is always available.

Steps

1. **Open Library.** Tap Library in the bottom navigation. Saved documents appear as cards with a thumbnail of the first page, name, page count, size, and modification date.

2. **Open in Sign.** Tap Open in Sign on a card to load the document into the Sign workspace.

3. **Open in Tools.** Tap Tools on a card to load it into PDF Tools.

4. **Rename.** Tap Rename, type a new name, and confirm.

5. **Delete.** Tap Delete on a card. A confirmation prompt prevents accidental deletes.

6. **Refresh.** Tap Refresh to re-query IndexedDB if you've saved from another workspace.

Troubleshooting

Browser-local storage is NOT cloud backup. If you clear site data, reset the browser, or remove storage, saved documents are lost. To be safe, use Download on important documents.

Related topics

Save, download, share, and print, Get started with DocuScan Pro, Scan or import a document

21. Use the Help system

Find topics, search, and restart the interactive tutorial.

Purpose

Navigate the Help Center and restart walkthroughs.

What you need

None.

Steps

1. Open Help. Tap Help in the bottom navigation.

2. Search. Use the search field at the top. Type "sign", "scan", "watermark", "merge", etc. Topics filter live as you type.

3. Open a topic. Tap any topic card to open the full illustrated article. Articles include Purpose, Prerequisites, numbered Steps, Troubleshooting, and Related topics.

4. Back. Tap ‹ Back at the top of any article to return to the topic grid.

5. Restart tutorial. At the bottom of the Help workspace is a "Restart interactive tutorial" button. Tap it to replay the Home walkthrough from the beginning.

Troubleshooting

If search returns no results, try shorter keywords. The search matches against titles, subtitles, and tags.

Related topics

Get started with DocuScan Pro, Scan or import a document, Sign a PDF document, Merge two or more PDFs

22. Troubleshooting common issues

Camera, OCR, sharing, offline, and lost documents.

Purpose

Solve common problems quickly.

What you need

None.

Steps

1. Camera doesn't open. Check browser permissions (Settings → Privacy → Camera). Confirm the site is on HTTPS. As a fallback, use Import images.

2. OCR is slow. The first run downloads the Tesseract language model (a few MB). Subsequent runs are faster and work offline once cached.

3. PDF won't open. Make sure it's not password-protected. DocuScan Pro can parse encrypted PDFs but cannot re-save them.

4. Sharing unavailable. Some browsers don't support the Web Share API for files. The app automatically falls back to a download.

5. Lost documents. Browser-local storage is not cloud backup. Clearing site data, resetting the browser, or removing storage deletes saved documents. Always Download important files.

6. Offline use. The app shell and all dependencies are cached by the service worker. OCR, PDF preview, and PDF editing all work offline once the assets are cached.

Troubleshooting

For anything else, restart your browser. If problems persist, the app may have been updated — refresh to grab the latest version.

Related topics

Get started with DocuScan Pro, Use the document Library

23. Privacy and local storage

What stays on your device, what doesn't, and how to back up.

Purpose

Understand exactly what happens to your documents.

What you need

None.

Steps

1. **Local-first.** Documents are processed in your browser and stored in IndexedDB on your device.

2. **No uploads.** Nothing in the application transmits document content to any server.

3. **OCR on-device.** Tesseract.js runs entirely on-device once the language model is cached. First run downloads it from the official Tesseract data CDN.

4. **File validation.** Images are type- and size-validated before processing. PDFs are validated by checking the %PDF- magic bytes before parsing.

5. **No cloud backup.** Clearing site data, resetting the browser, or removing storage deletes saved documents. Use Download to save copies.

Troubleshooting

To check storage usage, open your browser's DevTools → Application → Storage. To clear all app data, use Clear site data — but back up first.

Related topics

Use the document Library, Troubleshooting common issues

Appendix: Privacy & Local Storage

DocuScan Pro is local-first. Your documents are processed in your browser and stored in IndexedDB on your device. Documents are NOT uploaded to any server. OCR runs entirely on-device once the language model is cached. Browser-local storage is NOT cloud backup — clearing site data, resetting the browser, or removing storage deletes saved documents. Always use Download to keep copies of important files.

Version 7.7 — Updated controls and workflows

This chapter supersedes older control names and arrangements in the historical walkthroughs. The original detailed help topics are retained above. Check the actual application before assuming an advanced feature is available on every browser.

Navigation and tours

1. 1. Bottom navigation: Home, Sign, Tools, Studio, Library, Help. Use the bottom navigation to move between workspaces.
2. 2. Tour This Page is located in the top header before the online-status indicator. Tour steps should be closed before starting another workflow.
3. 3. Use the browser Back and Forward controls carefully: they may navigate browser history rather than undo a document edit. Use the in-app Undo and Redo for document changes.

PDF Tools: six categories

4. 1. The categories are arranged in three equal-width rows: Markup | Text & Images; Pages | Advanced; Combine & Compare | Batch.
5. 2. Selecting a category displays only its tools; selecting the active category again collapses its options. Switching categories hides the previous category options.
6. 3. In Text & Images, OCR and Invert are the first two controls. OCR recognizes text in scanned pages; Find searches existing text.
7. 4. Undo, Redo and Remove controls appear before Export. Export actions should only be enabled when a usable result is available.

Studio: images, enhancements, and PDFs

8. 1. Import Images opens an image chooser; camera capture is a separate control and is not in the import menu.
9. 2. Enhancement actions are blue. Select a thumbnail, apply the desired enhancement, and inspect the result before building a PDF.
10. 3. Select Page Size and Orientation, then Create PDF. Continue using Edit in Sign or Edit in Tools.
11. 4. OCR is computationally intensive; process modest batches, review the text, and keep a downloaded copy of important documents.

Audio feedback

12. 1. The header sound control cycles through Off, Buttons only, and Buttons + typing where supported. Sound requires a user gesture in some browsers.
13. 2. Sound is optional and must never prevent an action from completing. Device silent mode and browser policies may override sound.

Practical document-size guidance

14. 1. Conservative engineering targets pending native-device validation: up to 50 imported images; process OCR in batches of up to 20 pages; target up to 100-page PDF opening.
15. 2. These numbers are NOT verified universal limits. File resolution, image compression, browser memory, and device model matter more than page count alone.
16. 3. Stress-test targets include 100 images, 50-page OCR batches and 250–1,000-page PDFs. Do not claim these are supported until real-device testing passes.
17. 4. Back up documents with Download before clearing browser site data. Browser-local Library contents may be deleted when site storage is cleared.

Testing and troubleshooting

18. 1. Use the bundled fixtures: photo-1.jpg, photo-2.jpg, photo-3.jpg, document-5-pages.pdf, document-10-pages.pdf.
19. 2. Run static checks and browser test scripts; save screenshot output separately by iPhone, iPad, Android, and desktop profile. Emulated profiles are not proof of native-device behavior.
20. 3. If an import, export, camera, or OCR action fails, capture the browser console, device/browser version, input size, exact steps, and a screenshot.
21. 4. If browser automation reports ERR_BLOCKED_BY_ADMINISTRATOR, the environment prevented the test from running; this is NOT a passed application test.

Release verification status

v7.7 is a partially validated release candidate. Fixture integrity and source-level checks can pass without proving live browser import/export, OCR, camera capture, native device compatibility, or crash resistance. Consult TEST_REPORT_7.7.md and tests/results for actual execution evidence.

Interactive Tour This Page — v7.7

Every workspace has a Tour this page control in the header, before the connection status. Tours use Next, Back, and Skip; the target control is highlighted. A new tour starts at the beginning of its workspace. The Tour This Page worksheet in the UI Field Reference workbook is the source of truth for text changes and test IDs.

Studio walkthrough

1. Document Studio

Capture photos or import images, enhance selected pages, recognize text when needed, and create a PDF. Target: intro card

2. Take a photo

Use Camera for new photos. Import Images is for pictures already saved on your device. Target: #btnCaptureCamera

3. Import Images

Choose existing photos. The camera is a separate action; it is not in the import menu. Target: #btnImportImages

4. Review your pages

Select thumbnails to review page order, rotation and deletions before creating a PDF. Target: #studioThumbs

5. Enhance images

Use the blue enhancement actions to improve readability. Preview each change and reset if needed. Target: #enhancePresets

6. Recognize text

OCR recognizes text within scanned pictures; Find Text searches text that is already recognized or embedded. Target: #btnRunOcr

7. Previous and next

Use page navigation to check every image, including the first and last page. Target: #studioPageNav

8. Create PDF

Select page size and orientation, then Create PDF. Continue with Edit in Sign or Edit in Tools. Target: #btnCreatePdf

9. Edit in Sign

Move the created PDF to Sign to add signatures, dates or text. Target: #btnSendToSign

10. Edit in Tools

Move the created PDF to PDF Tools for further document changes. Target: #btnSendToTools

Tools walkthrough

1. PDF Tools

Choose one of six categories. Only the selected category displays its operations; tap the category again to collapse it. Target: intro card

2. Open a PDF

Load the document you want to edit. Target: #btnOpenPdfTools

3. Optional second PDF

Add another document for merge or comparison operations. Target: #btnAddSecondPdf

4. Six tool categories

Row 1: Markup and Text & Images. Row 2: Pages and Advanced. Row 3: Combine & Compare and Batch. Choose one category at a time. Target: #toolsGroups

5. Markup

Choose annotation, watermark, image watermark, header/footer, or form tools. Target: [data-group="content"]

6. Text & Images

OCR and Invert appear first, followed by the other text and image operations. The buttons use equal sizes. Target: [data-group="extract"]

7. Pages

Choose Pages to reveal page operations. Switching to another category hides Pages options. Target: [data-group="pages"]

8. Advanced

Choose Advanced for additional PDF operations. Target: [data-group="properties"]

9. Combine & Compare

Merge documents or compare two PDFs here. Target: [data-group="combine"]

10. Batch

Run supported multi-document operations here. Target: [data-group="batch"]

11. Apply and review

Apply the selected operation, inspect the preview, and use the export actions. Undo, Redo and Remove are above export. Target: #btnRunToolOp

Release checklist

Each release must update the app tour definitions, Help manual DOCX and PDF, Tour This Page worksheet, Help inventory, and automated tour regression checks together. Test Next, Back, Skip, missing targets, modal overlay, and iPhone/iPad/Android viewport layout. A static selector check is not a substitute for native-device testing.
