DocuScan Pro Help Manual

Version 7.75.0 Test Build 1
Build 7.75.0-test1
Built 2026-11-08T16:13:52.969848+00:00

Scan and import images, edit and sign PDFs, manage pages, and keep documents in your local Library. This manual follows the Help content included in this test build. Review OCR and edited output before sharing it.

What changed in this build

PDF naming, renaming, folders, stamps and folder selection use app dialogs. Save accepts the name; Cancel or Escape dismisses the dialog. PDF filenames are made portable and receive one .pdf extension.

Scan shows loading stages separately from recognition progress and identifies the current page. First use still downloads OCR assets; the English model is not bundled in this build.

Text in Sign is staged for placement: type text, tap Text, then tap the page once. W-9 and other existing PDF forms support text and checkbox edits.

Device Self-Test offers isolated fixture workflows. Its temporary Library is separate from your documents. NOT RUN results identify work that the test did not exercise. A component or layout pass does not certify every button.

Before you test

Keep backups of important documents. Use the bundled sample images and PDFs for the first pass. In About, confirm version 7.75.0 and build 7.75.0-test1. If a previous version remains visible after deployment, close and reopen the app and reload once. Avoid clearing browser storage because that can remove local Library documents.

Automatic cross-device sync is not included. Export Library Backup and Restore Library Backup move copies manually through Files or another location you choose. Native camera, share, print and accessibility behavior must still be checked on physical devices.

Home

Get started with DocuScan Pro

Understand what DocuScan Pro does and where to begin.

Before starting: A web browser. No account required.

1. Welcome. DocuScan Pro is a browser-based tool for scanning documents, creating PDFs, signing them, and organizing files locally. Everything stays on your device.

2. Home screen. When you open the app you land on the Home screen. It shows four prominent workflow cards: Studio, Sign, PDF Tools, and Library.

3. Quick start list. Below the four cards, a Quick start list lets you jump directly into the most common tasks: scanning, signing, or opening a saved document.

4. Bottom navigation. The bar pinned to the bottom of every screen has six icons: Home, Sign, Tools, Studio, Library, and Help. Use it to switch workspaces at any time.

If something goes wrong: If you don't see the four cards, you may have scrolled - try scrolling up or pressing Home in the bottom navigation.

Document Studio

Scan or import a document

Turn paper documents or existing images into clean PDF files.

Before starting: A camera-equipped device (for capture) or images on your device.

1. Open Studio. Tap Studio in the bottom navigation. Select an Expense claim, Signed document, or My checklist template if you want to track what belongs in the packet.

2. Capture with camera. Tap "Capture with camera". Your browser will request camera permission. On phones, the rear camera is preferred. Capture a page; tap to retake if needed.

3. Or import images. Tap Import files to choose photos and ordinary PDFs together. Select a thumbnail, then use Move page earlier or Move page later to move it one position in the exported packet. The preview arrows only browse. Fillable or password-protected PDFs open separately in PDF Tools.

4. Review thumbnails. Captured or imported pages appear in the Pages strip as numbered thumbnails. Tap a thumbnail to select it. Selected pages are outlined in blue.

5. Rotate, reorder, delete. Use Rotate, ‹ Move left, Move right ›, or Delete on the selected page. Clear all empties the strip.

6. Enhance. Pick a preset (Auto, Grayscale, B&W, Brighten, Contrast+), optionally adjust Brightness / Contrast sliders, then tap Apply to selected page. The original is preserved - Reset restores it.

7. Scan (optional). Tap Scan to recognize all imported image pages. Watch the loading status while the OCR engine and language model prepare; recognition progress then shows the current page and overall completion. Recognized text appears in the textarea and can be copied or downloaded as .txt.

8. Create the PDF. Choose page size (Letter, A4, or Fit-to-image) and orientation (Auto, Portrait, Landscape), then tap Create PDF. The PDF is saved to your Library automatically.

9. Hand off. Use Edit in Sign › or Edit in Tools › to continue working on the new PDF without leaving the app.

If something goes wrong: If the camera doesn't open, check browser permissions (Settings → Privacy → Camera) and confirm you're on HTTPS. As a fallback, use Import files to pick a photo from your camera roll.

Enhance image quality

Improve readability of scanned or photographed pages.

Before starting: At least one page loaded in Studio.

1. Select a page. Tap the thumbnail of the page you want to improve. A blue outline confirms the selection.

2. Choose a preset. Tap one of the chips in the Enhancement section: Original, Auto, Grayscale, B&W, Brighten, or Contrast+.

3. Fine-tune (optional). Drag the Brightness and Contrast sliders. The numbers update live (-100 to +100).

4. Apply. Tap Apply to apply the enhancement to all current image pages. Existing PDF pages are preserved.

5. Reset. Tap Reset to restore the original image. The original canvas is preserved, so this is always safe.

If something goes wrong: If the thumbnail doesn't change after Apply, make sure a page is selected (blue outline) before tapping Apply. If the colors look wrong, try Original to revert.

Recognize text with OCR

Turn scanned images into editable, searchable text.

Before starting: A scanned page with printed text. Handwriting is not well supported.

1. Select a page. Tap a thumbnail in the Pages strip.

2. Scan. Tap Scan to recognize the image pages in Studio. Existing PDF pages keep their original content and searchable text.

3. Watch the progress bar. A progress bar appears below the Scan button. On the first run it may pause while the language model downloads (a few MB).

4. Review recognized text. When complete, the recognized text appears in the textarea. It may include minor errors - OCR is never perfect.

5. Copy or download. Tap PDF to save a searchable copy to Library. Download .txt exports a separate text file. Run Scan again after editing an image if you want its latest text embedded.

If something goes wrong: If OCR returns "(No text recognized.)", try a higher-resolution scan, sharper lighting, or convert the image to B&W first. The first run downloads OCR components and language data; loading time depends on the connection. Loading and recognizing are shown as separate stages. Later runs can reuse cached assets.

Create a PDF from pages

Assemble one or more images into a single PDF document.

Before starting: At least one page loaded in Studio.

1. Choose page size. In the Create PDF section, pick Letter (8.5×11"), A4 (210×297mm), or Fit to image.

2. Choose orientation. Pick Auto (uses each image's aspect ratio), Portrait, or Landscape.

3. Create PDF. Tap Create PDF. Enter a name in the dialog and choose Save to store the PDF in Library. Cancel or Escape closes the dialog without saving. Names are cleaned for portability and exported with one .pdf extension. Choose Small, Standard or Original quality for photo pages. OCR from unchanged image pages is embedded as searchable text.

4. Hand off. Optionally tap Edit in Sign › or Edit in Tools › to continue working.

If something goes wrong: If Create PDF is disabled, add at least one page first. If the button shows a spinner forever, the network may be slow loading pdf-lib - try again in a moment.

Studio · Rotate

Rotate the selected page, then check the preview.

Before starting: Open the workspace and load the required files.

1. Rotate. Rotate the selected page, then check the preview.

Studio · Clear all

Remove the pages from the current Studio packet.

Before starting: Open the workspace and load the required files.

1. Clear all. Remove the pages from the current Studio packet.

Studio · Apply enhancement

Adjust brightness or contrast, then apply the changes to all current image pages.

Before starting: Open the workspace and load the required files.

1. Apply enhancement. Adjust brightness or contrast, then apply the changes to all current image pages.

Studio · Reset enhancement

Restore the selected image and reset its enhancement controls.

Before starting: Open the workspace and load the required files.

1. Reset enhancement. Restore the selected image and reset its enhancement controls.

Studio · Auto-crop

Detect the page edges and trim extra background. Review the crop in the preview.

Before starting: Open the workspace and load the required files.

1. Auto-crop. Detect the page edges and trim extra background. Review the crop in the preview.

Studio · Straighten page

Tap the four page corners in the preview to correct perspective.

Before starting: Open the workspace and load the required files.

1. Straighten page. Tap the four page corners in the preview to correct perspective.

Studio · Show original

Toggle between the edited page and the original.

Before starting: Open the workspace and load the required files.

1. Show original. Toggle between the edited page and the original.

Studio · Move page earlier

Move the selected page one position toward the beginning of the exported PDF.

Before starting: Open the workspace and load the required files.

1. Move page earlier. Move the selected page one position toward the beginning of the exported PDF.

Studio · Move page later

Move the selected page one position toward the end of the exported PDF.

Before starting: Open the workspace and load the required files.

1. Move page later. Move the selected page one position toward the end of the exported PDF.

Studio · Read aloud

Run Scan first, then listen to the recognized text.

Before starting: Open the workspace and load the required files.

1. Read aloud. Run Scan first, then listen to the recognized text.

Studio · Copy text

Copy recognized text to the clipboard.

Before starting: Open the workspace and load the required files.

1. Copy text. Copy recognized text to the clipboard.

Studio · Download text

Save recognized text as a text file.

Before starting: Open the workspace and load the required files.

1. Download text. Save recognized text as a text file.

Studio · Undo

Reverse the most recent Studio edit.

Before starting: Open the workspace and load the required files.

1. Undo. Reverse the most recent Studio edit.

Studio · Redo

Restore the most recently undone Studio edit.

Before starting: Open the workspace and load the required files.

1. Redo. Restore the most recently undone Studio edit.

Studio · Remove

Remove the selected page from the packet.

Before starting: Open the workspace and load the required files.

1. Remove. Remove the selected page from the packet.

Studio · Library

Create the PDF, then use Library to save it in the app.

Before starting: Open the workspace and load the required files.

1. Library. Create the PDF, then use Library to save it in the app.

Studio · Download

Save the created PDF to your device.

Before starting: Open the workspace and load the required files.

1. Download. Save the created PDF to your device.

Studio · Share

Review file size and choose a quality before opening the share sheet.

Before starting: Open the workspace and load the required files.

1. Share. Review file size and choose a quality before opening the share sheet.

Studio · Print

Open the system print controls for the created PDF.

Before starting: Open the workspace and load the required files.

1. Print. Open the system print controls for the created PDF.

Sign

Sign a PDF document

Add your signature to an existing PDF.

Before starting: A PDF file on your device.

1. Open the PDF. Tap Open PDF from Files at the top of the left sidebar in the Sign workspace. Choose a PDF. It loads in the preview on the right.

2. Create a signature. Tap the Signature button (one of the six editing buttons in two rows of three). A sheet slides up with two tabs: Draw and Type.

3. Draw or type. In Draw mode, sign with your finger, Apple Pencil, or mouse on the signature pad. In Type mode, enter your name and pick a font style.

4. Insert. Tap Insert signature. The signature is placed at the center of the current page as a movable overlay.

5. Move and resize. Click the signature to select it (blue border + resize dot appears). Drag the body to move; drag the blue dot in the bottom-right corner to scale.

6. Download. When you're happy, tap Download PDF to save the signed PDF to your device. Use Library if you want to keep it in the app for later.

If something goes wrong: If the signature doesn't appear, check that you're on the correct page (use the page navigation bar). If the overlay shows the wrong color, set the Ink color before inserting.

Add text to a PDF

Add typed text or reusable phrases to a PDF.

Before starting: A PDF open in the Sign workspace.

1. Type your text. In the Text / typed signature field, type the text you want to insert. Or pick from Quick Text Templates (Approved, Received, Paid, Confidential, Draft, Final, For Review).

2. Choose font. Pick a Font style (Helvetica, Times Roman, Courier, etc.) and a Font size in points. This controls the text inside the PDF, not the interface.

3. Pick ink color. Use the Ink color color picker. The color you pick is the color of the text in the final PDF.

4. Insert. Tap Text, then tap the PDF where the text should appear. Repeated Text taps do not add extra annotations. You can also type text and tap directly on the preview.

5. Move and resize. Click the text element to select it. Drag the body to reposition; drag the blue dot in the bottom-right corner to scale.

If something goes wrong: If nothing happens when you click on the page, make sure the Text / typed signature field isn't empty - type something first. If the ink color doesn't match, set the color before inserting.

Insert the current date

Stamp the current date onto a PDF.

Before starting: A PDF open in the Sign workspace.

1. Pick font and color. Set the Font style, Font size, and Ink color as you want the date to appear.

2. Tap Date. Tap the Date button (one of the six editing buttons). Today's date is inserted near the bottom of the current page.

3. Move if needed. Click the date text to select it, then drag to move it to your preferred position.

If something goes wrong: The date is generated by your browser's locale. If the format isn't what you want, type your own date into the Text field instead and use the Text button.

Add a watermark to a PDF

Apply a text watermark to every page of a PDF.

Before starting: A PDF open in the Sign workspace.

1. Configure the watermark. In the Watermark section: set Watermark text (default DRAFT), pick Direction (Diagonal ↗ or Horizontal), and set Opacity (0-100%).

2. Insert. Tap Insert. The watermark is applied across ALL pages of the document. A badge confirms "Watermark applied".

3. Verify. The displayed opacity value matches the actual opacity baked into the PDF.

4. Remove. Tap Remove watermark to revert. (Note: this currently reverts to the originally-loaded PDF and discards other edits added after the watermark.)

If something goes wrong: If the watermark is invisible, increase the Opacity. At 0% it's fully transparent. At 100% it's solid gray text.

Undo, Redo, and Remove Selected

Revert changes and clean up unwanted elements.

Before starting: A PDF open in the Sign workspace.

1. Undo. Tap Undo (one of the six editing buttons, bottom row). Each press reverts to the previous state in the history stack.

2. Redo. Tap Redo to re-apply a change you just undid. The Redo stack clears when you make a new edit.

3. Remove Selected. Tap an element on the canvas to select it (blue border + resize dot). Then tap Remove Selected to delete it.

If something goes wrong: If Undo is disabled, you're at the bottom of the history stack. If Remove Selected is disabled, no element is currently selected - click on one first.

Save, download, share, and print

Understand the four consistent export actions and when to use each.

Before starting: A document ready to export.

1. Library. Stores the document in the app's local IndexedDB library. Use this when you want to come back to the document later from inside DocuScan Pro.

2. Download PDF. Triggers a browser download of the PDF file to your device. The file lands in your normal Downloads folder.

3. Share PDF. Shows the PDF file size first. If a smaller copy is available, choose it or share the selected quality. Supporting devices open the system share sheet. Other browsers download the selected copy.

4. Print PDF. Opens the browser's print dialog in a hidden iframe so you don't lose your place in the app. Choose your printer and paper as usual.

If something goes wrong: If Share doesn't show the system sheet, your browser doesn't support Web Share API for files - use Download instead. Print may pop a blocker; allow pop-ups for the app.

PDF Tools

Merge two or more PDFs

Combine several PDFs into a single file.

Before starting: Two or more PDF files on your device.

1. Open the primary PDF. In PDF Tools, tap Open PDF. This is File A - the base document.

2. Open a second PDF. Tap Open 2nd PDF (for merge). This is File B.

3. Select Merge. Tap the Merge tab in the Operation row.

4. Choose order. Pick Append second PDF (B comes after A) or Prepend second PDF (B comes before A).

5. Run. Tap Run. The merged PDF appears in the Preview area.

6. Export. Use Library, Download, Share, or Print at the bottom of the card.

If something goes wrong: If Run is disabled, you haven't loaded both PDFs yet. Open PDF = File A, Open 2nd PDF = File B.

Split a PDF by page ranges

Extract specific pages or ranges from a PDF.

Before starting: A PDF with multiple pages.

1. Open the PDF. Tap Open PDF in PDF Tools.

2. Select Split. Tap the Split tab.

3. Enter ranges. Type page ranges in the format 1-3,5,8-10. Spaces around the dashes are optional. The total page count is shown for reference.

4. Run. Tap Run. The first split file appears in the Preview area; additional files are saved to your Library automatically with names like "Split part 2".

5. Export. Use Save / Download / Share / Print for the first file. Additional parts are already in your Library.

If something goes wrong: If you see "Range X-Y out of bounds", check the total page count shown in the panel. Ranges are 1-indexed and must satisfy 1 ≤ from ≤ to ≤ total.

Rotate PDF pages

Fix pages that are sideways or upside down.

Before starting: A PDF open in PDF Tools.

1. Open the PDF. Tap Open PDF in PDF Tools.

2. Select Rotate. Tap the Rotate tab.

3. Pick angle. Tap 90°, 180°, or 270°. Rotation is applied cumulatively on top of the existing orientation.

4. Run + Export. Tap Run to apply, then use Save / Download / Share / Print.

If something goes wrong: Rotation applies to ALL pages in the document. If you need to rotate only specific pages, split first, rotate the part, then merge.

Reorder PDF pages

Change the page order of a multipage PDF.

Before starting: A multipage PDF open in PDF Tools.

1. Open the PDF. Tap Open PDF in PDF Tools.

2. Select Reorder. Tap the Reorder tab.

3. Enter new order. Type a comma-separated list of the new page positions, 1-indexed. For a 3-page PDF, "3,1,2" moves page 3 to position 1, page 1 to position 2, and page 2 to position 3. The placeholder shows the default order.

4. Run + Export. Tap Run, then Save / Download / Share / Print.

If something goes wrong: The list must be a complete permutation. For 3 pages you need exactly 3 unique numbers from 1-3. Duplicates or missing numbers will be rejected.

Annotate a PDF with text

Add text annotations to PDF pages.

Before starting: A PDF open in PDF Tools.

1. Open the PDF. Tap Open PDF in PDF Tools.

2. Select Annotate. Tap the Annotate tab. Two sub-tabs appear: Text and Draw.

3. Stay in Text mode. The Text sub-tab is active by default.

4. Set page + text. Pick the Page number and type the annotation Text (e.g. "Reviewed by J.S.").

5. Position + color. Set Position X and Position Y as percentages (0-100), pick an Ink color, and a Font size in points.

6. Run + Export. Tap Run to bake the annotation into the PDF, then Save / Download / Share / Print.

If something goes wrong: If Run is disabled, type some text first. The annotation appears at the chosen X/Y position (0,0 = top-left; 100,100 = bottom-right).

Draw freehand on a PDF

Add freehand drawings (circles, arrows, underlines) directly onto PDF pages.

Before starting: A PDF open in PDF Tools, ideally with Preview loaded.

1. Open the PDF. Tap Open PDF in PDF Tools. Wait for the page to render in the Preview area.

2. Select Annotate → Draw. Tap the Annotate tab, then the Draw sub-tab.

3. Choose pen settings. Pick the Page to draw on, choose a Pen color, and adjust Pen width (1-20).

4. Draw. Draw directly on the page preview with your finger, Apple Pencil, or mouse. Strokes appear in real time on the transparent overlay.

5. Clear (optional). Tap Clear strokes to start over without affecting the underlying PDF.

6. Run + Export. Tap Run to bake the strokes into the PDF as a transparent PNG layer. Then use Save / Download / Share / Print.

If something goes wrong: If the draw canvas doesn't respond, make sure you're in the Draw sub-tab (not Text). The overlay sits exactly on top of the rendered page - strokes map 1:1 to PDF coordinates.

Apply a watermark in PDF Tools

Apply a text or image watermark across all pages of a PDF.

Before starting: A PDF open in PDF Tools.

1. Open the PDF. Tap Open PDF in PDF Tools.

2. Select Watermark. Under Markup, tap Watermark and choose Text or Image.

3. Configure. For Text, set the wording, direction and opacity. For Image, upload a logo and set size, opacity, and the X and Y position.

4. Run + Export. Tap Run, then Save / Download / Share / Print.

If something goes wrong: If the watermark is invisible, increase opacity and review its position.

Compare two PDFs side-by-side

Visually compare two PDFs without leaving the app.

Before starting: Two PDF files on your device.

1. Open File A. Tap Open PDF in PDF Tools. This is File A.

2. Open File B. Tap Open 2nd PDF (for merge). This is File B.

3. Select Compare. Tap the Compare tab. The Preview area below shows two labeled panes.

4. Run. Tap Run. Both first pages render at 380px width in their labeled panes.

5. Compare. Scroll the page to see both side-by-side. On mobile (below 768px), the panes stack vertically.

If something goes wrong: Compare is view-only - it doesn't modify either PDF. To produce a merged file, use the Merge tab instead.

PDF Tools · Talk to PDF

Open a searchable PDF, choose Talk to PDF, and ask a question. Review the matching passages and page numbers. For a scan, run Scan in Studio and create a searchable PDF first.

Before starting: Open the workspace and load the required files.

1. Talk to PDF. Open a searchable PDF, choose Talk to PDF, and ask a question. Review the matching passages and page numbers. For a scan, run Scan in Studio and create a searchable PDF first.

PDF Tools · Annotate

Choose Text to place a note or Draw to mark the page by hand. Choose the page, then apply the annotation.

Before starting: Open the workspace and load the required files.

1. Annotate. Choose Text to place a note or Draw to mark the page by hand. Choose the page, then apply the annotation.

PDF Tools · Annotate Text

Enter the note, set its position and size, and apply it to the selected page.

Before starting: Open the workspace and load the required files.

1. Annotate Text. Enter the note, set its position and size, and apply it to the selected page.

PDF Tools · Annotate Draw

Draw with a finger, stylus or mouse. Clear to start over, or apply the drawing.

Before starting: Open the workspace and load the required files.

1. Annotate Draw. Draw with a finger, stylus or mouse. Clear to start over, or apply the drawing.

PDF Tools · Watermark

Choose Text for words or Image for a logo. Set opacity and apply it to all pages.

Before starting: Open the workspace and load the required files.

1. Watermark. Choose Text for words or Image for a logo. Set opacity and apply it to all pages.

PDF Tools · Image watermark

Choose Image, upload a logo, then set Size and Opacity. Use Position X and Y to place it.

Before starting: Open the workspace and load the required files.

1. Image watermark. Choose Image, upload a logo, then set Size and Opacity. Use Position X and Y to place it.

PDF Tools · Header/Footer

Enter header or footer text and choose a page number format, then apply.

Before starting: Open the workspace and load the required files.

1. Header/Footer. Enter header or footer text and choose a page number format, then apply.

PDF Tools · Forms

Apply to find fillable fields. Enter values, then save the filled PDF.

Before starting: Open the workspace and load the required files.

1. Forms. Apply to find fillable fields. Enter values, then save the filled PDF.

PDF Tools · Split

Select page ranges to export as separate PDFs.

Before starting: Open the workspace and load the required files.

1. Split. Select page ranges to export as separate PDFs.

PDF Tools · Split by Size

Enter a size target to divide the PDF into smaller parts.

Before starting: Open the workspace and load the required files.

1. Split by Size. Enter a size target to divide the PDF into smaller parts.

PDF Tools · Delete Pages

Enter the page numbers or ranges to remove, then preview the result.

Before starting: Open the workspace and load the required files.

1. Delete Pages. Enter the page numbers or ranges to remove, then preview the result.

PDF Tools · Insert Page

Choose a PDF and enter the page after which to insert it. Use 0 to insert at the start.

Before starting: Open the workspace and load the required files.

1. Insert Page. Choose a PDF and enter the page after which to insert it. Use 0 to insert at the start.

PDF Tools · Reorder

Drag thumbnails or type a custom page order, then apply and review the preview.

Before starting: Open the workspace and load the required files.

1. Reorder. Drag thumbnails or type a custom page order, then apply and review the preview.

PDF Tools · Rotate

Select an angle and apply it to the chosen pages.

Before starting: Open the workspace and load the required files.

1. Rotate. Select an angle and apply it to the chosen pages.

PDF Tools · Crop

Enter how much of each margin to trim, then check the preview.

Before starting: Open the workspace and load the required files.

1. Crop. Enter how much of each margin to trim, then check the preview.

PDF Tools · Merge

Open the second PDF and apply to append it to the first.

Before starting: Open the workspace and load the required files.

1. Merge. Open the second PDF and apply to append it to the first.

PDF Tools · Compare

Open two PDFs and apply to view their pages side by side.

Before starting: Open the workspace and load the required files.

1. Compare. Open two PDFs and apply to view their pages side by side.

PDF Tools · OCR

Choose Scan text to recognize text in the PDF. Review or download the result.

Before starting: Open the workspace and load the required files.

1. OCR. Choose Scan text to recognize text in the PDF. Review or download the result.

PDF Tools · Invert

Apply to reverse page colors and review the new appearance.

Before starting: Open the workspace and load the required files.

1. Invert. Apply to reverse page colors and review the new appearance.

PDF Tools · Extract Text

Read the existing text layer. Copy or download the result. Use OCR for image-only pages.

Before starting: Open the workspace and load the required files.

1. Extract Text. Read the existing text layer. Copy or download the result. Use OCR for image-only pages.

PDF Tools · PDF to Image

Choose the page and output settings, then export an image.

Before starting: Open the workspace and load the required files.

1. PDF to Image. Choose the page and output settings, then export an image.

PDF Tools · Metadata

Edit the document title, author or other metadata fields and apply.

Before starting: Open the workspace and load the required files.

1. Metadata. Edit the document title, author or other metadata fields and apply.

PDF Tools · Bookmarks

Enter a bookmark title and target page, then apply.

Before starting: Open the workspace and load the required files.

1. Bookmarks. Enter a bookmark title and target page, then apply.

PDF Tools · Compress

Choose whether to preserve text and forms or use an image-only level, then review the output.

Before starting: Open the workspace and load the required files.

1. Compress. Choose whether to preserve text and forms or use an image-only level, then review the output.

PDF Tools · Protect

Enter the password options and apply before exporting.

Before starting: Open the workspace and load the required files.

1. Protect. Enter the password options and apply before exporting.

PDF Tools · Batch

Select the input PDFs and operation, then run the batch.

Before starting: Open the workspace and load the required files.

1. Batch. Select the input PDFs and operation, then run the batch.

Library

Use the document Library

Manage documents saved locally in your browser.

Before starting: None. The Library is always available.

1. Open Library. Tap Library in the bottom navigation. Saved documents appear in compact rows. Choose a file action above the list, then select the files.

2. Open in Sign. Choose Open in Sign or Open in Tools, select one PDF, then confirm.

3. Move files. Choose Move, select one or more files, then choose a folder.

4. Rename. Choose Rename and select one or more files. Enter a separate name for each file in the naming dialog. Choose Save, or Cancel to stop renaming.

5. Delete. Choose Delete and select the files. Confirm the count before deleting.

6. Share. Choose Share and select one PDF. Review the file size and choose how to share it.

7. Refresh. Tap Refresh to re-query IndexedDB if you've saved from another workspace.

If something goes wrong: Browser-local storage is NOT cloud backup. If you clear site data, reset the browser, or remove storage, saved documents are lost. To be safe, use Download on important documents.

Library · Library backup and restore

Export a backup, then move it to iCloud Drive or Google Drive using Files. On the other device choose Restore Library Backup and select the file. Each restore adds copies of the PDFs and folders.

Before starting: Open the workspace and load the required files.

1. Library backup and restore. Export a backup, then move it to iCloud Drive or Google Drive using Files. On the other device choose Restore Library Backup and select the file. Each restore adds copies of the PDFs and folders.

Help and diagnostics

Use the Help system

Navigate the Help Center and restart walkthroughs.

Before starting: None.

1. Open Help. Tap Help in the bottom navigation.

2. Search. Use the search field at the top. Type "sign", "scan", "watermark", "merge", etc. Topics filter live as you type.

3. Open a topic. Tap any topic card to open the full illustrated article. Articles include Purpose, Prerequisites, numbered Steps, Troubleshooting, and Related topics.

4. Back. Tap ‹ Back at the top of any article to return to the topic grid.

5. Restart tutorial. At the bottom of the Help workspace is a "Restart interactive tutorial" button. Tap it to replay the Home walkthrough from the beginning.

If something goes wrong: If search returns no results, try shorter keywords. The search matches against titles, subtitles, and tags.

Troubleshooting common issues

Solve common problems quickly.

Before starting: None.

1. Camera doesn't open. Check browser permissions (Settings → Privacy → Camera). Confirm the site is on HTTPS. As a fallback, use Import files.

2. OCR is slow. The first run downloads the Tesseract language model (a few MB). Subsequent runs are faster and work offline once cached.

3. PDF won't open. Make sure it's not password-protected. DocuScan Pro can parse encrypted PDFs but cannot re-save them.

4. Sharing unavailable. Some browsers don't support the Web Share API for files. The app automatically falls back to a download.

5. Lost documents. Browser-local storage is not cloud backup. Clearing site data, resetting the browser, or removing storage deletes saved documents. Always Download important files.

6. Offline use. The app shell and all dependencies are cached by the service worker. OCR, PDF preview, and PDF editing all work offline once the assets are cached.

If something goes wrong: For anything else, restart your browser. If problems persist, the app may have been updated - refresh to grab the latest version.

Privacy and local storage

Understand exactly what happens to your documents.

Before starting: None.

1. Local-first. Documents are processed in your browser and stored in IndexedDB on your device.

2. No uploads. Nothing in the application transmits document content to any server.

3. OCR on-device. Tesseract.js runs entirely on-device once the language model is cached. First run downloads it from the official Tesseract data CDN.

4. File validation. Images are type- and size-validated before processing. PDFs are validated by checking the %PDF- magic bytes before parsing.

5. No cloud backup. Clearing site data, resetting the browser, or removing storage deletes saved documents. Use Download to save copies.

If something goes wrong: To check storage usage, open your browser's DevTools → Application → Storage. To clear all app data, use Clear site data - but back up first.

Physical device test checklist

1. Import three JPGs, run Scan, review all page text, create a named PDF, and reopen it from Library. Cancel a second creation and confirm no extra PDF was saved.
2. Open a PDF in Sign. Tap Text repeatedly, place it once, then use Undo and Redo. Add a drawn signature and watermark, export and reopen the result.
3. Open the blank W-9 in PDF Tools. Detect existing fields, enter sample text, select a checkbox, apply changes, save and reopen the PDF. Confirm both values are retained.
4. Run About > Device Self-Test with fixture workflows enabled. Download JSON and identify PASS, FAIL and NOT RUN results separately. Stop a run and confirm the app remains usable.
5. On the actual device, capture a photo, share a PDF through the native share sheet, and print or preview printing. These interactions cannot be certified by viewport emulation.
