DocuScan Pro

Local-first document scanning, editing, signing, and PDF tools. Version 7.5.9 — November 2026.

What it is

DocuScan Pro is a Progressive Web App (PWA) for scanning, editing, signing, and manipulating PDF documents entirely in the browser. Documents stay on your device (IndexedDB) — nothing is uploaded to a server. The app works offline after first load and can be installed to the home screen on iOS, iPadOS, and Android.

Six workspaces

- **Home** — entry hub with workflow cards routing to each workspace.
- **Studio** — capture via camera (with auto timestamp) or import images; enhance with presets and brightness/contrast sliders; run OCR (Tesseract.js); assemble into a PDF.
- **Add Text & Sign** — open a PDF and add signatures, text, dates, stamps, highlights, underlines, and watermarks. Drag to position; undo/redo supported.
- **PDF Tools** — 23 operations on existing PDFs: merge, split, split-by-size, rotate, reorder, delete, insert, crop, annotate (text or draw), watermark, image watermark, header/footer, bookmarks, metadata, forms, extract text, compress, protect, invert, to-image, compare, batch, undo/redo, and OCR.
- **Library** — local IndexedDB storage with thumbnails, search, folders, rename, and delete.
- **Help** — searchable topic index plus an interactive walkthrough tutorial.

Layout (v7.4.x)

Studio, Add Text & Sign, and PDF Tools share the same two-column layout: controls on the left, live preview on the right. Page navigation (‹ Page X of N ›) and a page slider live directly beneath each preview pane. The OCR result panel appears as a second preview card below the main preview, with Copy / Download .txt / Read aloud actions grouped at its bottom.

Privacy

All processing happens locally in the browser. The only network requests are for CDN-hosted libraries (pdf.js, pdf-lib, Tesseract.js language data) on first use. Documents never leave the device.

Deployment

Static files served from GitHub Pages. No backend required. Clone the repository and open index.html, or visit the production URL.

Home

The Home workspace is the entry point. Three workflow cards route you to Studio (scan / OCR), Add Text & Sign (annotations), and PDF Tools (merge / split / rotate / watermark / OCR). The bottom navigation bar carries you between every workspace.

Studio

Studio captures or imports images, enhances them, optionally runs OCR, and assembles them into a PDF. The 2-column layout puts controls on the left and a live preview on the right with page navigation and an OCR result panel beneath it. Camera captures are stamped with a discreet date+time marker.

Add Text & Sign

Open a PDF and add signatures, text, dates, stamps, highlights, underlines, and strikethroughs. Drag elements on the preview to position them; undo / redo history tracks every change. Diagonal or horizontal watermarks apply across all pages.

PDF Tools

PDF Tools operates on existing PDFs: merge, split, split-by-size, rotate, reorder, delete pages, insert, crop, annotate (text or draw), watermark, image watermark, header/footer, bookmarks, metadata, forms, extract text, compress, protect, invert, to-image, compare, batch, undo/redo, and OCR.

PDF Tools — OCR

Switching to the OCR tab renames the Run button to "Scan" and reveals a second preview pane below the main preview. After Scan completes, the recognized text appears with Copy / Download .txt / Read aloud actions. The Language and Pages selectors stay on the left.

Library

The Library stores documents locally in your browser via IndexedDB. Searchable, with thumbnails, page counts, and actions to open, rename, move into folders, or delete. Nothing is ever uploaded to a server.

Help

The Help workspace offers a searchable topic index and an interactive first-time walkthrough. The "Tour this page" button on each workspace highlights the key controls with contextual explanations.
